Introduction: Fixed Point Analysis

Given the system of differential equations:

$$y' = f(y)$$

Definition

A fixed point y^* is defined by $f(y^*) = 0$.

- Solve the equation f(y) = 0
- Analyse eigenvalues of the Jacobian at fixed points.

Jonas Ibn-Salem () Bifurcation 10.01.13 3 / 12

Bifurcation

Now: System with *controle parameter* μ .

$$y' = f(y, \mu)$$

How does μ influence the fixed points?

4□ > 4□ > 4 = > 4 = > = 9 < 0</p>

Jonas Ibn-Salem () Bifurcation 10.01.13 4 / 12

Bifurcation

Now: System with *controle parameter* μ .

$$y' = f(y, \mu)$$

How does μ influence the fixed points?

- Change of FP stability
- Change of FP number and location.

Jonas Ibn-Salem () Bifurcation 10.01.13 4 / 12

Bifurcation

Now: System with *controle parameter* μ .

$$y' = f(y, \mu)$$

How does μ influence the fixed points?

- Change of FP stability
- Change of FP number and location.

Definition

 $\it Bifurcation$ is the changing of the character of an equilibrium point and/or the creation of extra ones by alteration of a control parameter.

The value of μ where bifurcation occurs is called a *bifurcation point*.

Example: Logistic growth with harvesting

Growth of a (fish) population under harvesting (fishing):

$$y' = \frac{1}{10}y(10 - y) - \mu$$

Solving $f(y, \mu) = 0$ for any parameter μ .

Jonas Ibn-Salem () Bifurcation 10.01.13 5 / 12

Example: Logistic growth with harvesting

Growth of a (fish) population under harvesting (fishing):

$$y' = \frac{1}{10}y(10 - y) - \mu$$

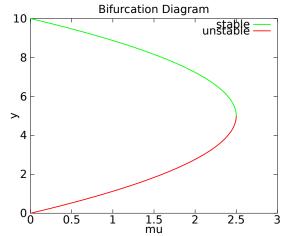

Solving $f(y, \mu) = 0$ for any parameter μ .

Fixed points at

$$y_{1/2} = 5 \pm \sqrt{25 - 10\mu}$$

Stability:

$$\lambda = \frac{df}{dy} = -\frac{2}{10}y + 1$$

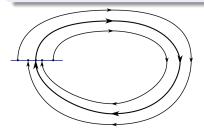

Jonas Ibn-Salem () Bifurcation 10.01.13 5 / 12

Hopf Bifurcation

Definition

A Hopf Bifurcation is the appearance or disappearance of a periodic orbit (limit cycle) through a local change in the stability properties of a fixed point.

It appears when a pair of complex conjugate eigenvalues around the fixed point crosses the imaginary axis of the complex plane.

10.01.13

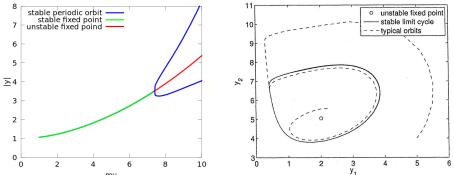

Hopf Bifurcation example

chlorine dioxide-iodine-malonic acid reaction

iodine:
$$y_1' = \mu - y_1 - \frac{4y_1y_2}{y_1^2 + 1}$$

chlorine dioxine: $y_2' = y_1(1 - \frac{y_2}{y_1^2 + 1})$

- Fixed points at $(y_1, y_2) = (\frac{\mu}{5}, \frac{1}{25}(\mu^2 + 25))$
- Bifurcation point at $\mu \approx 7.3$

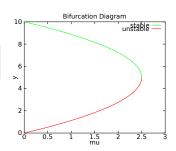

Jonas Ibn-Salem () Bifurcation 10.01.13 7 / 12

Numerical Bifurcation Analysis

How to draw the bifurcation diagram and find bifurcation points?

• Fixed point analysis for equidistant parameters μ is inefficient.

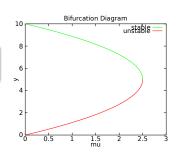

Jonas Ibn-Salem () Bifurcation 10.01.13 8 / 12

Numerical Bifurcation Analysis

How to draw the bifurcation diagram and find bifurcation points?

• Fixed point analysis for equidistant parameters μ is inefficient.

Idea: Path following

Follow the fixed point around the fold bifurcation curve.

Treat μ as an additional dependent variable in phase space and solve

$$f(y,\mu)=0$$

Jonas Ibn-Salem () Bifurcation 10.01.13

Numerical Bifurcation Analysis

- Given two nearby points $z_1=(y_1,\mu_1)$ and $z_2=(y_2,\mu_2)$
- Initial approximation $z_a = 2z_2 z_1$
- Additional equation: $(z_3 z_a) \cdot (z_a z_2) = 0$
- Solving for z_3 via Newton's method with init. approx. z_a

Jonas Ibn-Salem () Bifurcation 10.01.13 10 / 12

Summary

- Controle parameters can influence fixed points in ODE systems.
- At bifurcation points the stability, location and/or number of fixed points change.
- In a Hopf bifurcation a fixed point loses stability and a limit cycle occurs.
- Bifurcation can be analysed numerically using path following.
